

# PHYSICAL THERAPY

A Valuable Tool for Pain Management

#### PAIN & PT

- Low back pain. A review of >60 randomized controlled trials (RCTs) evaluating exercise therapy: decrease pain, improve function, and help people return to work.¹
- Before & after surgery. A review of 35 RCTs (~3,000 THA patients): preoperative exercise and education led to significant reductions in pain, shorter lengths of stay postoperatively and improvements in function.<sup>2</sup>
- Arthritis. PT exercise programs can reduce pain and improve physical function among individuals with hip and knee osteoarthritis.<sup>3,4</sup>

## HOW?

#### Advantages:

- Time
  - Assessment
  - Treatment
  - Education
- Experts in neuromusculoskeletal assessment and treatment
- Screen for red flags, impact of co-morbidities, patient safety

- Provides Experiential Learning
- Effective Training regimens
- Timing of Care
  - Secondary Prevention: halt the progression from Acute to Chronic Pain
- Able to simultaneously treat an acute flare up in the presence of a chronic pain state.

# Non-Pharmacological Therapies for Chronic Pain States

Strong **Evidence** 

- Education
- Aerobic exercise
- Cognitive behavior therapy

Modest **Evidence** 

- Strength training
- Hypnotherapy, biofeedback, balneotherapy

Weak **Evidence** 

 Acupuncture, chiropractic, manual and massage therapy, electrotherapy, ultrasound

No **Evidence** 

Tender (trigger) point injections, flexibility exercise

## PT's CONTRIBUTION TO E.R.A.S.E.

#### **E**MOTIONS

- Stressmanagement
- Pleasant activity scheduling
- Resilience

### REFLECTIONS

- Reframing
- Relaxation

## Actions

- Exercise
- Pacing
- Problem solving

# SLEEP

# ENVIRONMENT

Reinforce sleep hygiene

#### **Evidence Based Formats**<sup>5,6</sup>

- RPE: 6-7 is the target for effort that produces optimal results
- Graded Exposure
  - To foster patient engagement: may start lower... however, too low jeopardizes results.

# Rating of Perceived Exertion scale (RPE)

1	Very Light Activity (anything other than complete rest)
2-3	<b>Light activity</b> (feels like you can maintain for hours, easy to breath and carry on a conversation)
4-5	Moderate Activity (feel like you can exercise for long periods of time, able to talk and hold short conversations)
6-7	Vigorous Activity (on the verge of becoming uncomfortable, short of breath, can speak a sentence)
8-9	Very Hard Activity (difficult to maintain exercise intensity, hard to speak more than a single word)
10	Max Effort (feels impossible to continue, completely out of breath, unable to talk)

# MODERATE EVIDENCE: STRENGTH TRAINING

E.R.A.S.E: ACTION

## Impairment with ADL's

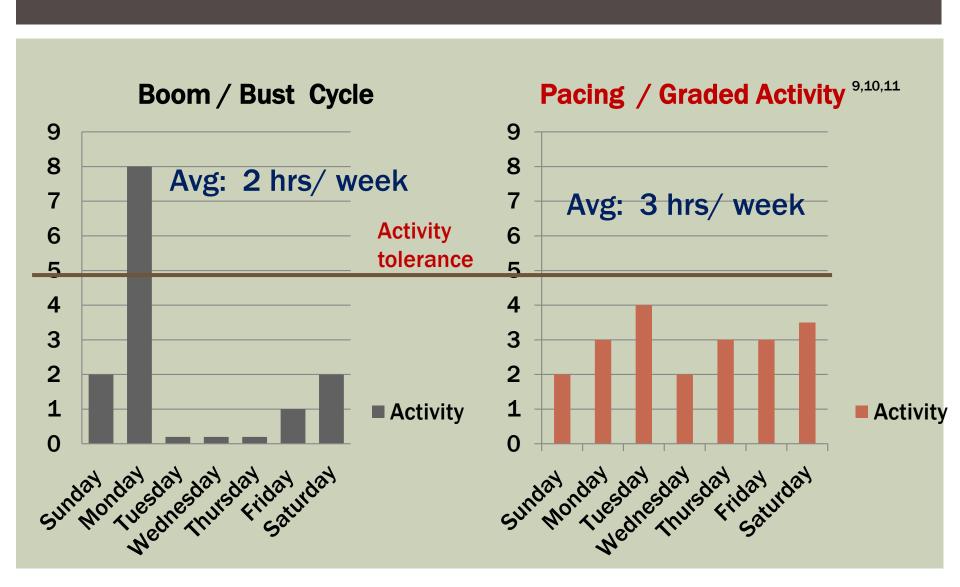

- Transfers
- Stair climbing
- Lift / push / pull / carry.
- **Pro's** 7,8
  - Efficient: 1-2 times a week
  - Prior history of strength training
  - Endogenous opiate release

#### Con's

Dose/response carefully monitored and scripted to not further sensitize patient to becoming active.

# **BEST EVIDENCE: EDUCATION**

E.R.A.S.E: ACTION

#### **BEST EVIDENCE: EDUCATION**

E.R.A.S.E: REFRAMING

#### **Neuroscience of Pain**

Nerves send messages to your brain and your brain decides how much pain you feel—a *lot, a little, or none at all.*<sup>21</sup>

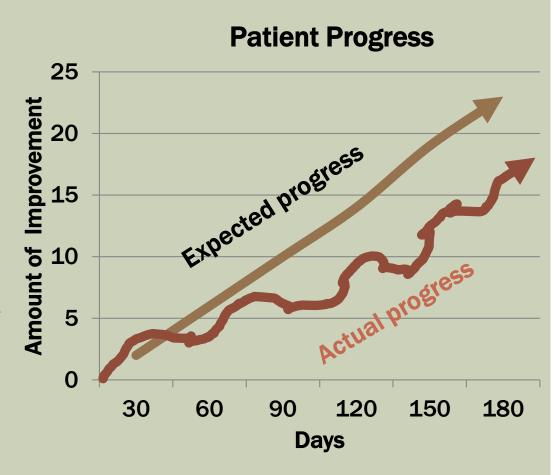

- Pain is always real, but not always the result of a physical injury.
- The brain is constantly asking:
  - How dangerous is this?
  - Constantly scanning the body and environment for potential threats.
  - The brain notices a threat and reacts with a pain sensation.

- Sometimes the brain continues to send a pain signal long after the injury has healed for several reasons:
- Increased stress and anxiety from:
  - Not knowing the cause of the pain
  - Not knowing how long the pain will last
  - Unsuccessful pain treatments
  - Pain limiting normal activity

# LIFE IS CURVY

#### **Chronic Pain**

- Set Proper Expectations
- Goal is: Less pain & Increased Activity
  - Time
    - 6+ months, not 6 visits
    - Neuroplastic changes take time
  - Setbacks are to be expected
    - Focus is on building Resilience
